PROJECT CASE STUDY

Goodman Group

A corporate portfolio website connecting one group identity to five distinct businesses through bespoke company profiles, clear discovery, and a shared enquiry channel.

SYSTEM	SCOPE	APPROACH
Corporate Portfolio Website	**Group · Five Companies Profiles · Enquiries**	**Server-First Bespoke Profiles**

01 The Problem

A group website needs to present a coherent parent brand without flattening the identities of the businesses it represents.

Pharmaceutical manufacturing, medical-equipment trading, chemicals, medical billing, and a pharmaceutical business have different stories and information needs. A uniform profile template would obscure those differences; disconnected pages would make the portfolio harder to navigate.

> Goodman Group brings the group narrative, five company profiles, business facts, and enquiry journey into one connected website — while preserving a distinct presentation for each business.

02 What Was Built

A connected portfolio spanning group storytelling, company discovery, individual business profiles, and direct enquiries.

GROUP LANDING PAGE

Introduce the Group through its story, portfolio, leadership, history, and business presence, with clear routes into individual companies.

COMPANY DIRECTORY

Browse five companies from a shared registry, with consistent summaries, logos, and direct links to dedicated profiles.

BESPOKE COMPANY PROFILES

Present each business through its own page composition, company-specific content, visual language, and shared group navigation.

ENQUIRY & DISCOVERY

Connect visitors to a validated enquiry form and keep page metadata, organization data, and sitemap entries aligned.

03 How It Works

Next.js serves the group, directory, and company routes from typed content records. Focused client components add browser interactions, while a dedicated server endpoint handles enquiry delivery.

Browser → Next.js App Router → Server-rendered pages

Typed company registry → Directory · Profiles · Metadata · Sitemap

Enquiry form → Validation → Upstash rate limit → Resend email

Content & route composition

A readonly company registry supplies shared identity and directory facts. Dedicated route components combine those records with company-specific data. CompanyGroupFrame provides navigation and framing, not a generic profile renderer.

Browser interaction & motion

Local client components manage navigation, theme preference, pointer glow, and enquiry state. The homepage loads Lenis, GSAP, and ScrollTrigger lazily; scroll behavior respects reduced-motion preferences and effect cleanup.

Enquiry validation & delivery

The browser and server share field validation. The API checks origin and content type, limits the request body to 16 KiB, rejects honeypot submissions, and uses a Redis-backed per-IP limit before sending through Resend.

Discovery & route boundaries

Page metadata, Organization JSON-LD, sitemap URLs, and robots configuration use shared site and company data. Unknown company slugs resolve to an explicit not-found page rather than an invented profile.

04 Key Features

Group-level storytelling — a dedicated landing page brings the portfolio, leadership, history, and business presence into one narrative.

Five distinct company profiles — Goodman Laboratories, Geron Pharma, Goodman Medical Equipment, Wal Green Chemicals, and Goodman Billing each have a dedicated route.

Consistent company discovery — a registry-driven directory and portfolio links make it straightforward to move from the Group to a specific business.

Shared navigation, individual identity — company framing keeps group-level navigation consistent while each profile controls its own content and styling.

Persistent theme preference — pre-hydration initialization, stored preferences, system-theme handling, and company palette synchronization coordinate the viewing experience.

Considered browser interactions — mobile navigation, keyboard focus management, native disclosures, pointer-aware glow, and reduced-motion handling support different ways of browsing.

Validated enquiry workflow — company selection, field errors, submission states, server-side validation, rate limiting, and email delivery form one connected contact path.

Search-ready structure — route-specific metadata, canonical URLs, Organization JSON-LD, sitemap, and robots endpoints support machine-readable discovery.

Layered quality tooling — Vitest, React Testing Library, Playwright, and Axe provide unit, component, browser-journey, and automated accessibility checks.

05 Technical Approach

The implementation separates static portfolio content, route composition, browser effects, and enquiry delivery. The following stack supports those boundaries.

LAYER	STACK	PURPOSE
Application	Next.js 16 App Router; React 19; strict TypeScript	Server-first routes and focused client interactions
Content & discovery	Readonly TypeScript records; Next.js metadata; Organization JSON-LD	Shared company facts, canonical URLs, and sitemap
Presentation	Tailwind CSS v4; company-scoped CSS; Lucide icons	Shared visual foundations and distinct profile identities
Motion & themes	Lenis; GSAP / ScrollTrigger; local state and browser storage	Scroll choreography, reduced-motion handling, and theme persistence
Enquiry delivery	Node.js route handler; shared validation; Upstash Redis; Resend	Bounded requests, per-IP rate limits, and email delivery
Quality & packaging	Vitest; Testing Library; Playwright / Axe; Next.js standalone output	Behavioral checks, browser journeys, and deployment packaging

Design decisions that matter

One registry, multiple surfaces. Shared company identity feeds the directory, profile lookup, enquiry choices, and discovery endpoints rather than being copied into separate models.

Reuse the frame, not the entire page. A narrow shared shell keeps navigation consistent without forcing unrelated businesses into a single profile template.

Explicit delivery boundaries. Enquiry success follows an email-provider receipt. Missing configuration, throttling, and delivery failures remain visible error paths.

06 Value Delivered

From a collection of business identities to a coherent, navigable corporate portfolio:

Coherent

GROUP IDENTITY

Distinct

COMPANY PROFILES

Connected

DISCOVERY & ENQUIRIES

- ✓ **A clearer route into the portfolio.** — The group landing page and company directory offer complementary ways to find a business and explore its role within the Group.
- ✓ **Room for each business to be itself.** — Bespoke profiles accommodate different services, capabilities, markets, and content structures without losing shared navigation.
- ✓ **Less duplicated portfolio data.** — Typed records connect visible business facts with metadata, enquiry choices, and discovery endpoints, reducing parallel sources of truth.
- ✓ **A practical path from interest to contact.** — The enquiry journey connects company selection to validated, rate-limited email delivery, with explicit feedback when a submission cannot be sent.

Goodman Group — a server-first corporate portfolio combining a shared group identity, five bespoke company experiences, and a connected enquiry workflow in one website.
